THE TWO VERSIONS OF TRADING — AND WHY YOU WERE ONLY SHOWN ONE

TEN CHAPTERS · FROM ABSOLUTE ZERO · FREE

CHAPTER ZERO OF THE MACRO SCHOOL

MAISON YR

MAISONYRTRADING.COM

READ THIS FIRST

Two versions of trading exist. You were only shown one.

There is the version sold on social media: indicators, signal groups, candlestick patterns, get rich by Friday. And there is the version that runs inside banks and funds: slower, structured, built on understanding why markets move before touching a single entry.

This is written for one person — someone who was never shown how markets actually move. If you have never traded, that is exactly where you are, and this is the map handed to you before the wrong version finds you. If you have been trading for two years off signals and patterns and it has not worked, you are in the same seat. You were simply given the wrong map first, and it will explain a lot of confusion in a few pages.

Each chapter puts the two versions side by side: the retail version — the one social media sells to everyone — and the desk version, the one that runs inside banks and funds. You will see the gap for yourself.

WHERE THIS PACK SITS

This pack is Chapter Zero of the Macro School. The Macro School is twenty-one written chapters — the macro layer taught properly, one market at a time — and it lives inside the Live Trading Floor, the paid room of the MAISON YR group. Two of those twenty-one are open free in the Lobby — the free room of the same group, on Skool, at skool.com/maison-yr-trading, no payment and no call to get in — right now: Chapter One, The Regime — The Anchor Of The Macro Layer, and The VIX — The Price Of Fear. Complete pages, not samples.

Chapter One assumes you already know what moves a market. That is what these ten chapters are for. Finish this, and Chapter One will read like plain English. The pack and the School are one ladder, not two piles.

MAISON YR

THE MACRO STARTER PACK

READ THIS FIRST

WHO WROTE THIS

The man who wrote this joined a signals course at sixteen and spent a year inside it without ever becoming profitable — indicators, patterns, almost no macro, and nothing at all on risk or psychology. He went into a bank instead: first as the analyst furnishing the data, the news and the fundamentals to the traders on the desk, then trading the bank's capital himself. Last year a major US trading platform recruited him as a mentor, and he left it, because it was signals and no substance. He built this house to teach the version he had to find the hard way.

YANIS RUCQUOIS · MAISON YR

Two honest warnings before you start. One: nothing in these pages is financial advice — this is education, and every example is shown for understanding, not imitation. Two: this pack will not make you a trader by itself. Nothing written ever does. What it will do is fix the direction you are looking in — and that is the part almost nobody gets right on their own.

CONTENTS

Contents

Ten chapters. Read them in order — each one is built on the one before it.

01	The lie you were sold	05
02	Who actually moves price	08
03	The five forces	11
04	Central banks — the kings	14
05	Risk-on, risk-off	17
06	Charts — the retail version vs the desk version	20
07	The honest scoreboard	23
08	One real trade — the loss and the win	27
09	Why 1% is the whole game	32
10	The path	35
	Your next step — and one thing to do tomorrow	37

Every performance figure in these pages comes from the monthly report cards published on the public record. Nothing here is rounded up.

CHAPTER 01

The lie you were sold

Why most of what you've seen about trading was designed to sell you something — not to make you money.

Trading has a bad reputation. It earned it.

Scroll for five minutes and you will find them: rented cars, borrowed watches, screenshots of wins with no losses in sight, and a course or a signal group waiting at the link in bio. That world is loud, it is everywhere — and it is not trading. It is marketing dressed as trading.

THE RETAIL VERSION

Trading is fast money. Find the right indicator, copy the right signals, and the account grows while you sleep. More trades means more money. Bigger risk means faster success.

THE DESK VERSION

Trading is one of the oldest professions in the world — and inside banks and funds it looks nothing like social media. It is slow, deliberate and structured. Fewer trades, not more. Risk controlled first, profit second. The professionals who last are not the ones with the hottest streak — they are the ones with the strongest rules.

Here is the test that separates the two versions instantly: ask where the person's losses are. A real record includes them, counted and published, because every real trader has them. A marketing account hides them. That single question cuts through almost everything.

REMEMBER —

IF YOU CAN'T SEE THE LOSSES, YOU'RE NOT LOOKING AT A RECORD. YOU'RE LOOKING AT AN AD.

RUN THE TEST ON THIS PACK

Fair is fair — so here are ours, before you have read anything else. Across six public months the record holds 114 trades: 62 winners, 25 break-evens and 27 losses. The 27 are printed with the rest, numbered and counted at the size they were actually taken. Not one of them was quietly removed. Chapter seven puts the whole scoreboard on one page and shows you how to read it.

Why the fake version spreads faster

Selling a dream is easier than teaching a craft. A signal seller earns whether you win or lose — many earn from the broker commissions your trades generate, which means their business gets paid when you trade more, not when you trade well. Understand that incentive and the whole landscape suddenly makes sense.

REMEMBER —

ASK WHO GETS PAID, AND WHEN. THE ANSWER EXPLAINS ALMOST EVERYTHING YOU SEE ONLINE.

CHAPTER 02

Who actually moves price

It is not you, and it is not anyone in your group chat.

The market is an ocean. Know who the whales are.

Every price you see — the euro, gold, the Dow — is just the meeting point of buying and selling at this second. The question that matters is: whose buying and selling? Because not all money is equal. Your order and a central bank's decision do not live in the same universe.

FIRST — WHAT A CURRENCY PAIR ACTUALLY IS

Nobody stops to explain this, so here it is. A currency has no price on its own. A euro is not worth a number — it is only ever worth some amount of something else. So every currency quote comes as a pair. EURUSD is the price of one euro in dollars. USDJPY is the price of one dollar in yen. The first currency is the thing being priced; the second is what it is priced in.

Which means buying a pair is two things in one transaction: you are long the first currency and short the second. Buy EURUSD and you have bought euros and sold dollars, in one click, whether anyone told you so or not.

ONE PAIR · ONE TRANSACTION · TWO CURRENCIES

And that is why a pair moves when either economy changes. EURUSD can rise because Europe got stronger, or because America got weaker — and the chart looks identical in both cases. A falling pair does not mean something is broken. It means the second currency won. You are never betting on one boat. You are betting which of two tides is stronger.

THE RETAIL VERSION

Price moves because of chart patterns. The triangle broke, so the market went up. Support held, so it bounced. The candles explain the move.

THE DESK VERSION

Price moves because enormous pools of capital — central banks, commercial banks, funds, corporations — shift positions for real economic reasons. When billions move, price moves. The pattern on your chart is the footprint that big money leaves behind — the shape of the move, never the reason for it.

MAISON YR

THE MACRO STARTER PACK

CHAPTER 02 · WHO ACTUALLY MOVES PRICE

Think of it like waves on a beach. Retail traders study the foam — the shapes each wave leaves on the sand. Institutions watch the tide. The foam is real, you can see it and touch it — but the tide decides where the water goes. The professionals you have never heard of spend their time on the tide.

This is why two traders can look at the same chart and one survives the year while the other is wiped out: one is trading the shape, the other understands the force behind the shape. Same screen. Different game entirely.

REMEMBER —

INSTITUTIONS TRADE THE WHY. RETAIL TRADES THE SHAPE. THAT GAP IS THE ENTIRE INDUSTRY.

CHAPTER 03

The five forces

Everything that moves a market fits in one hand. Nobody ever counts them for you.

Five forces move every market on earth.

Strip away the noise and every candle on every chart traces back to five forces. You do not need to master them today. You only need to know they exist — because once you do, markets stop looking random.

01 MACROECONOMICS

The health of economies: growth, inflation, jobs. Strong economy, strong currency — weak economy, weak currency. Every data release you have ever seen mentioned (CPI, GDP, employment) is the market taking the economy's temperature.

02 CENTRAL-BANK POLICY

The price of money itself. When a central bank raises or cuts interest rates, it changes the value of holding that currency — and every asset priced in it. This force is so important it gets its own chapter next.

03 LIQUIDITY AND CAPITAL FLOWS

Where the big money is flowing, and what it is leaving. Money moves toward return and away from fear, across borders, every single day.

04 POSITIONING

What the big players are already holding. When everyone is leaning the same way, the market has a way of punishing the crowd — because a crowded trade has no one left to push it further.

05 SENTIMENT AND RISK EVENTS

Wars, elections, surprises — the mood of the market. Some days the world wants risk, some days it runs for shelter. The house calls that state THE REGIME, and it is the subject of chapter five.

Four of those five have their own chapters inside the Macro School: the release sheet for the data, central-bank days for policy, yields for the flows, and the regime and the VIX for sentiment. Two of those chapters are open free in the Lobby.

Here is what should bother you: how many of these five did your favorite trading page ever mention? Most retail education covers none of them. Not one. It goes straight to entries and patterns — the foam, never the tide.

The order everything runs in

If you remember one picture from this pack, make it this one. A force moves money. Moving money moves price. The pattern appears afterwards, as the record of what already happened. Retail education teaches the last box and skips the first two — which is why it can describe a move perfectly and never once predict one.

THE MECHANISM · IN ORDER

~~— THE RETAIL SHORTCUT: pattern → price —~~

REMEMBER —

MARKETS ARE NEVER RANDOM. YOU WERE JUST NEVER SHOWN THE FORCES.

CHAPTER 04

Central banks — the kings

One institution's decision can move every chart you watch. Meet the most powerful player in the game.

One meeting can move every market at once.

A few times a year, a room of people you have never met — the Federal Reserve in the US, the ECB in Europe, the Bank of Japan — decides the price of money: the interest rate. That single number quietly steers every market you have ever looked at.

THE RETAIL VERSION

News is noise. Turn off the calendar, the chart has everything priced in. Just trade the levels.

THE DESK VERSION

Interest rates are gravity for money. Raise them, and holding that currency pays more — capital flows in, the currency strengthens, and expensive assets like stocks and gold feel the pull. Cut them, and the opposite happens. When every market moves at once at 2:00 PM on a Wednesday, that is almost never a chart pattern — that is the Federal Reserve announcing its decision, and the meeting it comes from is called the FOMC.

INTEREST RATES ARE GRAVITY FOR MONEY

You do not need to understand policy documents. You need one mental picture: money is water, and interest rates tilt the ground. Water flows toward the higher rate, away from the lower one. Currencies rise where the money flows. That one image explains years of price action that patterns never will.

TWO WORDS THAT UNLOCK EVERY HEADLINE

HAWKISH means a central bank is raising rates, or leaning toward raising them — tighter money. DOVISH means it is cutting, or leaning toward cutting — easier money. That is the whole vocabulary. Every briefing, every headline, every market reaction on a decision day is some version of: was that more hawkish or more dovish than the market expected? Note the last four words. It is never the rate on its own. It is the rate against what everyone had already assumed.

MAISON YR

THE MACRO STARTER PACK

CHAPTER 04 · CENTRAL BANKS — THE KINGS

And here is the beginner's edge: central banks telegraph their moves. They give speeches, publish projections, and prepare markets in advance — and they publish all of it themselves, for free, on their own websites, including the calendar of the next decision. The Fed, the ECB and the Bank of Japan each print theirs in the open. The retail world simply never looks, because nobody told them it was the whole game. The Your Next Step page at the end of this pack sends you to one tomorrow morning.

When you want the full version: Central Bank Days — Reading The Decision, and The FOMC Playbook — No Forward Guidance, are chapters twenty and twenty-one of the Macro School inside the Floor.

REMEMBER —

WHEN THE MARKET MOVES 'FOR NO REASON' — A CENTRAL BANK IS USUALLY THE REASON.

CHAPTER 05

Risk-on, risk-off

The market has weather. Traders who can't read the sky get rained on.

The market's weather decides which trades can work.

Some days, the world feels safe: money leaves shelter and chases growth — stocks rise, riskier currencies rise. That is RISK-ON. Other days fear takes over: money runs home to safety — the Japanese yen, the Swiss franc, gold. That is RISK-OFF. Two states. The market's weather.

TWO STATES · CHECKED BEFORE ANY CHART IS OPENED

RISK-ON
money chases growth
stocks and riskier
currencies bid

RISK-OFF
money runs home
yen, franc and gold
bid

THE RETAIL VERSION

A good setup is a good setup. If the pattern is clean, take the trade — the chart doesn't care what's happening in the world.

THE DESK VERSION

The same setup that prints money in one weather fails in the other. Buying risk in a risk-off storm is swimming against the tide of every large pool of capital on earth. Professionals check the weather first — then decide which trades are even allowed today. It is the first filter, before any chart is opened.

You can feel this weather yourself, today, without a single indicator: when stocks fall hard while gold and the yen climb together, the market is scared. When everything risky rises together, the market is greedy. Watch those three move as one for a week and markets will never look random to you again — there is a version of that exercise waiting for you in Your Next Step at the end.

One honest caveat, because the free version of this idea is taught flat and it is not flat. The yen, the franc and gold behave as havens in most regimes — not in all of them. There are conditions under which the safety label fails completely and the so-called haven falls with everything else. Knowing when the label holds and when it breaks is where the real work starts, and it is exactly what the paid chapters are for.

The house's own word for it

What this chapter has called the weather has a proper name. The desk calls it THE REGIME — the state the market is in, which decides what can work and what cannot. It is not one indicator among many. It is the anchor of the whole macro layer: every read, every pair, every decision hangs off which regime is live.

Chapter One of the Macro School is The Regime — The Anchor Of The Macro Layer, and it is open free in the Lobby right now, in full. Nothing blurred, nothing to unlock, no call to book. You have just finished the prerequisite for it. Go and read it.

REMEMBER —

FIRST THE WEATHER, THEN THE TRADE. SETUPS DON'T BEAT STORMS.

CHAPTER 06

Charts — the retail version vs the desk version

Technical analysis isn't the enemy. Being told it's the whole game is.

The chart is the last layer. Not the first.

Here is where honesty matters: charts are useful. Zones of support and resistance, market structure, retracements — real tools, used on real desks daily. The scam is not technical analysis itself. The scam is teaching it as the whole game.

THE RETAIL VERSION

Learn enough patterns and the chart becomes a crystal ball. Head and shoulders, flags, triangles — memorize the shapes, trade the shapes, win.

THE DESK VERSION

On a professional desk the order runs the other way. First: WHY — what are the five forces saying, which direction does the macro support? Then: WHERE — the chart's job is timing and location. Where is the entry with the best price, where is the idea proven wrong, where is the target? The macro picks the direction. The chart times the trade. Two jobs, in that order — never reversed.

TWO JOBS · IN THIS ORDER

~~— THE RETAIL ORDER: pattern → trade → find a reason later —~~

Think of the difference like this: a pattern trader sees a doorway and walks through it, no idea what building it belongs to. A desk decides which building to enter first — then uses the chart to find the door. Same doorway. One of them knows where it leads.

What the chart is actually for

Once the macro has picked a direction, the chart does three jobs and no others. It finds a LOCATION — a price where the trade is worth taking rather than chased. It marks the point of INVALIDATION — the price that proves the idea wrong, which is where the stop goes and is the only reason a loss can be capped in advance. And it sets a TARGET, so the size of the reward is known before the risk is taken.

MAISON YR

THE MACRO STARTER PACK

CHAPTER 06 · CHARTS — THE RETAIL VERSION VS THE DESK VERSION

THE CHART'S THREE JOBS · AFTER THE MACRO, NEVER BEFORE

Notice what is missing from that list: the chart is never asked WHY. Ask a chart why and it will always answer, because a shape can be found in any data at all. That is the trap. A chart is a magnificent instrument for measuring an idea and a terrible one for supplying it.

This is why the same tools produce opposite results in different hands — and why traders who spent years on patterns feel something click when the macro finally enters the picture. The tools were never broken. The order was.

REMEMBER —

MACRO PICKS THE DIRECTION. THE CHART TIMES THE ENTRY. REVERSE THE ORDER AND YOU'RE GAMBLING.

CHAPTER 07

The honest scoreboard

If you can't measure it honestly, someone is lying to you — probably on purpose.

R — the score that can't be faked.

A screenshot of a five-figure win means nothing. Was it a lucky gamble risking half the account? Skill risking one percent? You cannot tell — and that is exactly why screenshots are the currency of fake trading. Professionals measure differently.

THE RETAIL VERSION

Results are dollars. Big number good, small number bad. Post the wins, delete the losses, count the followers.

THE DESK VERSION

Professionals score in R — multiples of what was risked. Risk 1% of the account and make 4x the risk: that is +4R, or +4%. Now every trade is comparable, every month is honest, and no screenshot can lie. A month at +47.26R with 1% risk per trade is +47.26% on the account — the same number twice, no tricks and no compounding games, because the 1% unit stays fixed for the whole month instead of being re-based upward as the account grows. Re-basing it would print a larger figure than the truth, so the house does not.

And one rule turns a scoreboard into proof. It is stated the same way everywhere this house publishes anything:

REMEMBER —

A TRADE COUNTS ON THIS RECORD ONLY IF IT WAS POSTED BEFORE ENTRY, OR CALLED LIVE WITH MEMBERS WATCHING IT HAPPEN. ZERO ADVANCE NOTICE MEANS IT DOES NOT COUNT — WINNERS INCLUDED.

Anyone can claim a win after the move. Calling it before, in writing or in front of a room, every time, with the losses counted — that cannot be faked at scale. Break-evens count too, at zero. Losses count at their real size. Nothing is edited afterward. That standard is rare for one reason: it is unforgiving.

The scoreboard itself

So here it is, on one page. Six months, published month by month as they closed, every trade scored in R, at 1% risk or less:

MAISON YR

THE MACRO STARTER PACK

CHAPTER 07 · THE HONEST SCOREBOARD

MONTH	RETURN	TRADES
APRIL 2026	+50.67%	13
MAY 2026	+29.35%	9
JUNE 2026	+49.02%	29
JULY 2026	+47.26%	39
AUGUST 2026	+68.37%	9
SEPTEMBER 2026	+26.11%	15
TOTAL	+270.78%	114

SIX PUBLIC MONTHS · RISK CAPPED AT 1% PER TRADE · COMBINED WIN RATE 54.4%

Now the caveat that belongs beside that total, because a number that size printed without one is exactly what chapter one told you to distrust. Six months is a short sample, and these six contained an unusually favourable macro run. The table is published for the standard it was kept to and for what it shows about how the wins and the losses were handled — not as a forecast, and not as a rate anyone should expect. Any house printing six months without saying so is selling something.

And the part almost nobody prints — how those 114 trades actually split:

56 WINNERS	20 BREAK-EVENS	23 LOSSES
----------------------	--------------------------	---------------------

Sixty-two winners out of a hundred and fourteen is a combined win rate of 54.4%. Read that again, because it is the most useful number in this pack: a little over half the trades won, and the account still grew +270.78%. That is not a contradiction — it is the entire point. Being right more often than not is worth very little on its own. What did the work was the shape of the wins against the losses.

Every one of those 27 losses had its size decided before the trade was taken, never during it — 1% of the account, and on a handful of the more aggressive entries, half of that. Not one of them exceeded 1%. That is what a stop is for. No winner was capped at anything: the largest single trade on this record ran to +15.24R on one 1% risk, and the three biggest all closed inside a single month. That asymmetry, repeated across a hundred and fourteen trades, is what a win rate of 54.4% is capable of. Chapter eight walks one of them start to finish.

MAISON YR

THE MACRO STARTER PACK

CHAPTER 07 · THE HONEST SCOREBOARD

WHY THE NUMBER ISN'T PRETTIER

Twenty-five break-evens are counted here as trades, at 0R. They did not have to be. Drop them from the count the way a marketer would — 62 winners against 27 losses — and the same record prints a 69.7% win rate. That version would be more impressive and less true, so the house publishes 54.4%. When you meet a win rate anywhere, that is now your first question: what did they do with the trades that finished flat?

REMEMBER —

POSTED BEFORE ENTRY, LOSSES INCLUDED, SCORED IN R. EVERYTHING ELSE IS CONTENT.

CHAPTER 08

One real trade — the loss and the win

One correct read paid the biggest trade on the record at the time. The same read then cost six stops. Both are printed.

30 April 2026. USDJPY.

This was the largest single trade on the published record for three months, until a CADJPY short closed at +15.24R in August and took the title: +10.05R, taken in two legs of +6.5R and +3.55R, closed on 30 April 2026, risking 1% — the desk's standard size. It is in this pack for one reason only, and it is not the size. It is that a chart could not have seen it coming and the macro could — and then, over the three months that followed, the very same read cost money six times. Both halves are printed here.

THE SETUP — WHY THE YEN WAS WEAK IN THE FIRST PLACE

Go back to chapter four and the picture is already built. Japan's central bank had held its interest rate near zero for years while other central banks — the Federal Reserve above all — held theirs far higher. Money is water and rates tilt the ground: holding yen paid you almost nothing, holding dollars paid you a great deal. So money left the yen, patiently, for years, and USDJPY — the price of one dollar in yen — kept grinding higher.

That is not a pattern. It is a rate gap doing exactly what a rate gap does. And it creates a problem for Japan, because a currency that keeps weakening makes everything the country imports — energy, food, materials — more expensive for everyone who lives there.

What an intervention actually is

When a currency moves far enough for long enough, a government can step into the market itself and buy its own currency in size, deliberately, to stop the slide. That is an intervention. It is not a trade. It is a policy decision, taken by people in a room, and it lands on the market in minutes.

Now ask what a chart could possibly have told you about it beforehand. Nothing. There is no candle for a decision that has not been announced. A pattern can describe the fall the moment it starts and cannot know a single thing about it one minute earlier, because the cause was never on the chart in the first place. This is the sharpest example in the pack of the gap chapter two described: the shape versus the reason.

WHAT THE DESK WAS READING BEFOREHAND

Here is the honest limit, and it matters more than the result: nobody can read the date of an intervention. It is a decision, not a schedule. What is readable in advance is the pressure — and all of it is public and free.

01 THE RATE GAP

How far apart the two central banks' interest rates actually are, and which way each of them is leaning — hawkish or dovish. Both published by the banks themselves.

02 HOW STRETCHED THE MOVE IS

How far and how fast the currency has already travelled in one direction. The further it goes, the more uncomfortable it becomes for the country that owns it.

03 WHAT OFFICIALS ARE SAYING

Finance ministries and central banks talk before they act — first they call the move excessive, then they say they are watching it closely, then they say they will not rule anything out. It is a public sequence, in public statements.

None of that gives you a date. What it gives you is a direction, a reason, and a level of risk worth taking — which is enough, because the position was sized so that being early was survivable. That is the whole method in one paragraph.

The call, and the receipt

The short was posted before entry, on that public reasoning, risking 1% of the account. When the intervention hit, the position was managed out in two legs — +6.5R and then +3.55R — for +10.05R in total, closed 30 April 2026. Here is the receipt as it was published — the call on the left, the close on the right.

RECEIPT N° 03 · USDJPY · CLOSED 30 APRIL 2026 · +10.05R AT 1% RISK

The same yen read paid on a second pair the same day — a EURJPY short closed at +7R. That is worth noticing. The idea was never 'USDJPY is going down'. The idea was 'the yen is about to be defended', and a read at that level shows up on every pair the yen touches. That is what reading the force rather than the shape buys you.

Now the half nobody posts

If the chapter stopped there it would be exactly the kind of content this pack exists to attack. So here is what happened next to the same idea, from the same record.

Across the six public months USDJPY was traded twelve times. Four won: +10.05R on 30 April, +2.8R in early July, +1R in mid-July, and +14.83R on 3 August. Two finished flat at break-even, both of them deliberate patience before a Bank of Japan meeting. And six lost — two stopped out in late May, two in June, two in July, every one of them counted on the card for the month it belonged to, at its real size. Five of the six were full 1% stops. The sixth, on 13 July, was a half-size entry and cost half as much: -0.5R, printed on the July card and on the public receipt wall marked half size, because a loss you shaded smaller has to be published smaller too.

The last of the six was a short posted before entry on 28 July and stopped the same day for -1R. It sits on the July card and on the public receipt wall, dated, beside that month's winners — go and read it there rather than take this page's word for it.

Add the twelve together and the yen thesis was worth +23.18R across six months. Two correct reads, six stops for being early in between them, and a net that paid heavily — because the winners were never capped and every loss was. The six stops are the price of holding a thesis while the environment decides when it is ready.

What this trade actually teaches

Three things, in order of how much they will save you.

01 BEING RIGHT IS NOT THE SAME AS BEING ON TIME

The read was correct in April and still correct in May and June — and it lost money in May and June. A mechanism tells you what will happen. It does not tell you when. Any education promising both is selling something.

CHAPTER 08 · ONE REAL TRADE — THE LOSS AND THE WIN

02 THAT IS PRECISELY WHY THE 1% RULE EXISTS

Six stops, none of them larger than 1%, is a survivable cost of being early. At ten percent a position it is a destroyed account, holding the identical, correct opinion. The rule is not caution. It is what buys you the right to be wrong six times and still be there for the seventh. That is the next chapter.

03 THE LOSSES WERE PUBLISHED TOO

Every stop above sits on the monthly card and on the public wall, next to the winner. That is the standard from chapter seven, applied to the trade this house is proudest of. A record that only survives when it is winning is not a record.

REMEMBER —

A LOSS WITH A REASON BEATS A WIN WITH A STORY. THE RECORD HOLDS BOTH — THAT'S THE POINT.

CHAPTER 09

Why 1% is the whole game

The least exciting rule in trading is the one that decides who's still here next year.

Survive first. Everything else is second.

Here is the math nobody shows you, and it is brutal. A loss and the gain needed to undo it are not the same size, and the gap widens fast:

IF YOU LOSE	YOU NEED, JUST TO GET BACK TO ZERO
-10%	+11.11%
-25%	+33.33%
-50%	+100.00%
-75%	+300.00%

Lose half an account and you need a full doubling simply to break even. Losses dig faster than wins climb, and that asymmetry kills more traders than bad analysis ever will.

THE RETAIL VERSION

You've got a great setup? Load up. Confidence is conviction — the bigger the position, the bigger the win. Scared money makes no money.

THE DESK VERSION

Professionals risk 1% of the account per trade — every trade, no exceptions for 'sure things', because there are no sure things. At 1%, a losing streak is survivable: five losses in a row is minus five percent, annoying and recoverable. At 10% risk, the same streak is approaching half the account gone — and the doubling problem begins. The 1% rule is not caution. It is what makes every other skill in trading possible.

This is not theory here, and you have already seen the proof. Every one of the 114 trades on the six-month record was taken at 1% risk or less — never more; a handful of the more aggressive entries were deliberately shaded to half. Twenty-seven of them lost. Not one loss exceeded 1% of the account, because the size was decided before the trade rather than during it — and the record still finished those six months at +270.78%. The 1% did not shrink the result. It is the reason there was still an account to produce one.

MAISON YR

THE MACRO STARTER PACK

CHAPTER 09 · WHY 1% IS THE WHOLE GAME

This is also the quiet test of any educator: do they talk about risk sizing before they talk about entries? The real ones always do — because they know the order in which trading actually breaks people.

REMEMBER —

LOSE 50%, NEED +100% BACK. RISK 1%, AND NO SINGLE DAY CAN END YOU.

CHAPTER 10

The path

From reading this page to reading the market. What the road actually looks like.

What the road actually looks like.

No honest version of this chapter promises a timeline. But the shape of the road is known, and it has an order.

01 UNDERSTANDING

The forces, the regime, the players. You have just started this, in these pages — and the next step is already open: the Macro School takes the macro layer market by market, and two of its chapters are free in the Lobby.

02 STRUCTURE

Risk rules written down before they are needed, a scoring system in R, and a journal. Boring, unglamorous, and the reason anyone is still trading in year three.

03 SCREEN TIME

Watching the forces move real prices, day after day, until the connections stop being something you look up and start being something you notice.

04 SIZE — AND ONLY FOURTH

Position size is the last thing to grow, not the first. And for most people it is not grown with life savings at all.

On that last point: funded traders are usually funded by someone else. There is an established route where a trader passes a firm's evaluation and then trades that firm's capital for a share of the profit. It rewards exactly what this pack describes — risk control, patience, process — and this desk has passed those evaluations. It is noted here so you know the route exists, not as a recommendation.

As for where this pack came from — everything in these pages runs live inside MAISON YR: a macro trading desk, opened up as an education house. The record in chapter seven is public. The free Lobby holds the receipt album, the monthly report cards, a folder of real desk analysis given away in full, and the two open Macro School chapters — skool.com/maison-yr-trading. The website holds the same record in one scroll. Both are open right now — judge it yourself before you believe a word of it.

And when you want more than the free room, the door is marked on the next page — with the price and the date printed, and no countdown. The house runs on a standard, not on urgency: every trade posted before entry, every month reviewed openly.

REMEMBER —

UNDERSTANDING, STRUCTURE, SCREEN TIME, THEN SIZE. TEACH TO FISH, NOT GIVE SIGNALS.

One thing to do tomorrow. Then one place to go.

A pack that ends in links is a pack that changes nothing. So this ends with an instruction instead — one you can finish before lunch, for free, with no account anywhere.

DO THIS TOMORROW

- 01 Write down three numbers: the current policy interest rate in the United States, in the eurozone, and in Japan. Each central bank publishes its own on its own site — [federalreserve.gov](https://www.federalreserve.gov), [ecb.europa.eu](https://www.ecb.europa.eu), [boj.or.jp](https://www.boj.or.jp). Four minutes. Then look at the gaps between them, and read chapter four again.
- 02 At the end of the day, look at three things together: stocks, gold and the yen. Write one line saying whether the market was scared or greedy, and why you think so. That line is a regime call. Do it for five days and chapter five stops being theory.
- 03 Read The Regime in the Lobby, free, and see whether the house's read matches yours.

That is the first real macro read most people ever do. Nothing to buy, nothing to book, nobody to ask.

Then: the Macro School.

One destination, not a menu. The Macro School is twenty-one written chapters that take the macro layer one market at a time — the dollar and yields, the euro and the pound, the yen and the franc, oil and the commodity currencies, gold, the indices, China, the release calendar, central-bank days. Mechanism only: no signals, no levels, no positions. It lives inside the Live Trading Floor.

Two of the twenty-one are open free in the Lobby right now, complete and unedited — not samples, the actual Floor pages:

- 01 CHAPTER ONE — THE REGIME · THE ANCHOR OF THE MACRO LAYER
Chapter five of this pack was the prerequisite for this one. Why the same asset, with the same label on it, behaves in opposite directions in different regimes — and how to tell which one you are in.
- 02 THE VIX — THE PRICE OF FEAR
How the market prices fear itself, what a spike means against a grind, and why the number everyone quotes is almost always read wrong.

Nothing there is blurred and there is nothing to unlock. You have just finished Chapter Zero — go and read Chapter One.

MAISON YR

THE MACRO STARTER PACK

YOUR NEXT STEP

01 The Macro School — in the free Lobby

The contents page of all twenty-one chapters, printed in the open, plus the two that are already open to read. Same room as the receipt album, the monthly report cards and a folder of real desk analysis given away in full.

skool.com/maison-yr-trading

02 The full record

The six documented months, the receipts and the standard, in one scroll.

maisonyrtrading.com

03 When you want the desk itself — the Floor

Every trade posted before entry, daily briefings, live sessions, the full curriculum and all twenty-one Macro School chapters. \$199 a month. Whoever joins keeps that rate for as long as they stay.

[Join the Floor – direct](#)

The market was never random.
Now you know where to look.

Keep this pack. Re-read chapter six in a month — it reads differently
once you have watched the forces move.

CHAPTER ZERO DONE · CHAPTER ONE IS OPEN
